# Package 'CohortExplorer'

# November 15, 2022

Type Package
<b>Title</b> An R package with a Shiny viewer to explore profiles of patients in a cohort.
Version 0.0.2
<b>Date</b> 2022-11-15
Maintainer Gowtham Rao <rao@ohdsi.org></rao@ohdsi.org>
<b>Description</b> An R package with a Shiny viewer to explore profiles of patients in a cohort.
<b>Depends</b> DatabaseConnector (>= 5.0.0), R (>= 4.1.0)
Imports checkmate, clock, dplyr, lifecycle, ParallelLogger, rlang
Suggests Eunomia, testthat, knitr, withr
Remotes ohdsi/Eunomia, ohdsi/ParallelLogger
License Apache License
RoxygenNote 7.2.2
VignetteBuilder knitr
Roxygen list(markdown = TRUE)
Encoding UTF-8
Language en-US

exportPersonLevelData
Index

exportPersonLevelData Export person level data for cohort

#### **Description**

Export person level data from omop cdm tables from eligible persons in the cohort.

### Usage

```
exportPersonLevelData(
  connectionDetails = NULL,
  connection = NULL,
  cohortDatabaseSchema = "cohort",
  cdmDatabaseSchema,
  vocabularyDatabaseSchema = cdmDatabaseSchema,
  tempEmulationSchema = NULL,
  cohortTable = "cohort",
  cohortDefinitionId,
  cohortName = NULL,
  sampleSize = 25,
  personIds = NULL,
  exportFolder,
  databaseId,
  shiftDates = FALSE,
  assignNewId = FALSE
)
```

# **Arguments**

#### connectionDetails

An object of type connectionDetails as created using the createConnectionDetails function in the DatabaseConnector package. Can be left NULL if connection is provided.

 ${\tt connection}$ 

An object of type connection as created using the connect function in the DatabaseConnector package. Can be left NULL if connectionDetails is provided, in which case a new connection will be opened at the start of the function, and closed when the function finishes.

# ${\tt cohortDatabaseSchema}$

Schema name where your cohort tables reside. Note that for SQL Server, this should include both the database and schema name, for example 'scratch.dbo'.

### cdmDatabaseSchema

Schema name where your omop cdm tables with person level data reside. Note that for SQL Server, this should include both the database and schema name, for example 'scratch.dbo'.

# vocabularyDatabaseSchema

Schema name where your omop vocabulary tables reside. It maybe the cd-mDatabaseSchema. Note that for SQL Server, this should include both the database and schema name, for example 'scratch.dbo'.

tempEmulationSchema

Some database platforms like Oracle and Impala do not truly support temp tables. To emulate temp tables, provide a schema with write privileges where temp tables can be created.

 ${\tt cohortTable} \qquad {\tt The \ name \ of \ the \ cohort \ table}.$ 

cohortDefinitionId

The cohort id to extract records.

cohortName (optional) Cohort Name

sampleSize (Optional, default = 20) The number of persons to randomly sample. Ignored, if

personId is given.

personIds (Optional) An array of personId's to look for in Cohort table and CDM.

exportFolder The folder where the output will be exported to. If this folder does not exist it

will be created.

databaseId A short string for identifying the database (e.g. 'Synpuf'). This will be displayed

in shiny app to toggle between databases. Should not have space or underscore

(\_).

shiftDates (Default = FALSE) Do you want to shift dates? This will help further de-

identify data. The shift is the process of recalibrating dates such that all persons

min(observation period start date) is 2000-01-01.

assignNewId (Default = FALSE) Do you want to assign a newId for persons. This will replace

the personId in the source with a randomly assigned newId.

## **Examples**

```
## Not run:
connectionDetails <- createConnectionDetails(
  dbms = "postgresq1",
  server = "ohdsi.com",
  port = 5432,
  user = "me",
  password = "secure"
)

exportPersonLevelData(
  connectionDetails = connectionDetails,
  cohortDefinitionId = 1234
)

## End(Not run)</pre>
```
